Ask Clinie

What is the treatment for hypertension?

How many diabetic patients visited last month?

Which clinic has the most dengue cases?

Start by asking a question above or type below

What is the treatment for hypertension?

C

Hypertension Treatment Overview

Management of hypertension involves a combination of **lifestyle modification** and **pharmacological therapy**. Treatment decisions should consider baseline blood pressure, cardiovascular risk profile, comorbid conditions, and patient age (Source: Hypertension (Chunk 2/5)).

Lifestyle Modification

Lifestyle changes are recommended for **all patients** with elevated blood pressure, regardless of whether medications are prescribed (Source: Hypertension (Chunk 2/5), (Chunk 3/5)). Primary care physicians should counsel patients on:

- **Diet:** Adopt a heart-healthy diet such as the **DASH diet** (increased fruits, vegetables, whole grains; reduced sodium <2,300 mg/day) (Source: Hypertension (Chunk 3/5), (Chunk 4/5)).
- **Weight Reduction:** Even modest weight loss can produce meaningful improvements (Source: Hypertension (Chunk 4/5)).
- **Exercise:** At least **150 minutes** of moderate aerobic exercise per week (e.g., brisk walking, cycling) (Source: Hypertension (Chunk 4/5)).
- **Alcohol:** Limit to no more than **two drinks per day for men** and **one drink per day for women** (Source: Hypertension (Chunk 4/5)).
- **Smoking:** Cessation should be strongly encouraged (Source: Hypertension (Chunk 4/5)).
- **Stress Reduction:** Techniques may include mindfulness, relaxation, and adequate sleep (Source: Hypertension (Chunk 4/5)).

Pharmacological Therapy

Medication therapy should be considered when (Source: Hypertension (Chunk 3/5)):

- Blood pressure remains **≥140/90 mmHg** despite lifestyle changes.
- Patients have **high cardiovascular risk**.
- Patients have **diabetes, chronic kidney disease, or prior cardiovascular disease**.

First-Line Agents: Several classes are considered appropriate first-line therapy (Source: Hypertension (Chunk 3/5)):

- **ACE Inhibitors** (e.g., Lisinopril, Enalapril, Ramipril): Effective for blood pressure reduction; protective in diabetes or kidney disease. Side effects may include dry cough, hyperkalemia, or angioedema.
- **ARBs** (e.g., Losart
